

Fundamentals of MCS (CS)

Mechanical proof assistance system (1)

Basic Definition: Types

- ❖ **Basic types**

- ❖ **nat** (natural numbers)
- ❖ **bool** (Boolean values)

- ❖ **Functional Types**

- ❖ **nat** \rightarrow **nat** (the type of functions that take a natural number and give a natural number)
 - ❖ **succ** : **nat** \rightarrow **nat** (next natural number)
- ❖ **nat** \rightarrow **nat** \rightarrow **nat** (the type of functions that take two natural numbers and give a natural number)
 - ❖ **plus** : **nat** \rightarrow **nat** \rightarrow **nat** ($_ + _$)
 - ❖ **mult** : **nat** \rightarrow **nat** \rightarrow **nat** ($_ \times _$)

- ❖ **&&**: **bool** \rightarrow **bool** \rightarrow **bool** (logical AND)

- ❖ **||**: **bool** \rightarrow **bool** \rightarrow **bool** (logical OR)

- ❖ **lessThan**: **nat** \rightarrow **nat** \rightarrow **bool** ($<$)

- ❖ **Generic Types** (or Types with parameters)

- ❖ **list** α (the type of a list, where α stands for the type of its elements. α can be instantiated by other types like **nat**, **bool**)
- ❖ **list nat** (the type of lists of natural numbers)
- ❖ **list bool** (the type of lists of Boolean numbers)

Outline

- ❖ Example: Arithmetic expression
 - ❖ Source Language: Structure and semantics of AE
 - ❖ Target Language: Stack-based virtual machine
 - ❖ Compiler
 - ❖ Correctness: Correctness condition of the whole system

Section	Content
Source Language	Formal specification of the grammar and semantics of arithmetic expressions
Target Language	Formal specification of the (stack) machine
Translation (Compiler)	Formal specification of the compiler, which translates an arithmetic expressions to an instruction sequence.
Translation Correctness	Proof of semantic equivalence between the arithmetic expressions and the instruction sequence.

Example

- ❖ A source-level arithmetic expression
 - ❖ $e = \text{Binop Times (Binop Plus (Const 2) (Const 3)) (Const 7)}$
- ❖ Instruction sequence
 - ❖ $\text{instr} = [\text{iConst 7}, \text{iConst 3}, \text{iConst 2}, \text{iBinop Plus}, \text{iBinop Times}]$
- ❖ Equivalence
 - ❖ The arithmetic expression e evaluates to **35**.
 - ❖ The stack machine executes instr and leaves **35** on the stack.

Source Language

Source Language

Grammar	Semantics (binopDenote / expDenote)
Inductive binop@p. 1 $\text{binop} :=$ Plus Times	Definition binopDenote@p. 1 $\mathcal{B} \text{ Plus} \Rightarrow \text{plus}$ $\mathcal{B} \text{ Times} \Rightarrow \text{mult}$
Inductive exp@p. 1 $\text{exp} :=$ Const n Binop $b \ e_1 \ e_2$	Definition expDenote@p. 2 $\mathcal{E} (\text{Const } n) \Rightarrow n$ $\mathcal{E} (\text{Binop } b \ e_1 \ e_2) \Rightarrow \mathcal{B} \ b \ (\mathcal{E} \ e_1) \ (\mathcal{E} \ e_2)$

Example

- ❖ `Const(42)`
- ❖ `Binop Plus (Const 2) (Const 3)`
- ❖ `Binop Times (Binop Plus (Const 2) (Const 3)) (Const 7)`

Target Language

PL Basic – Lists (1/2)

- ❖ $[1, 2, 3] : \text{list int}$
- ❖ $[\text{True}, \text{False}, \text{True}] : \text{list bool}$
- ❖ $[\text{"Hello"}, \text{"World"}] : \text{list string}$
- ❖ Generic lists (a list of arbitrary type α)
 - ❖ $[x_1, x_2, x_3] : \text{list } \alpha$, where $x_1 : \alpha$, $x_2 : \alpha$, and $x_3 : \alpha$

PL Basic – List (2/2) – constructors

- ❖ $\text{list} ::=$
 - | **nil**
 - | $x :: \text{list}$
- ❖ Examples
 - ❖ nil
 - ❖ $1 :: \text{nil}$
 - ❖ $1 :: 2 :: 3 :: \text{nil}$
 - ❖ $\text{True} :: \text{False} :: \text{nil}$
 - ❖ “ $x :: y :: z$ ” should be read as “ $x :: (y :: z)$ ”
- ❖ **Joining** two lists
 - ❖ $\text{list}_1 ++ \text{list}_2$
 - ❖ $[1, 2] ++ [3, 4] = [1, 2, 3, 4]$

Target Language

Grammar	Semantics (instrDenote / progDenote)
$\text{instr}@p. 2$ $\text{instr} ::=$ $ \text{iConst } n$ $ \text{iBinop } \text{binop}$	$\text{instrDenote}@p. 2$ $\mathcal{I} (\text{iConst } n) s \Rightarrow n :: s$ $\mathcal{I} (\text{iBinop } \text{op}) v_1 :: v_2 :: s \Rightarrow (\mathcal{B} \text{ op } v_1 v_2) :: s$ $\mathcal{I} (\text{iBinop } \text{op}) s \Rightarrow \text{error}$
$\text{program}@p. 2$ $\text{program} ::=$ $ \text{nil}$ $ \text{instr} :: \text{program}$	$\text{progDenote}@p. 2$ $\mathcal{P} \text{ nil } s \Rightarrow s$ $\mathcal{P} (i :: p') s \Rightarrow \mathcal{P} p' (v :: s)$ $\mathcal{P} p \text{ error} \Rightarrow \text{error}$

Grammar

Semantics (instrDenote / progDenote)

$instr ::=$

| iConst n

| iBinop $binop$

$I(iConst\ n)\ s \Rightarrow n :: s$

$I(iBinop\ op)\ v_1 :: v_2 :: s \Rightarrow (\mathcal{B}\ op\ v_1\ v_2) :: s$

$I(iBinop\ op)\ s \Rightarrow \text{error}$

some data 1

some data 2

...

n

some data 1

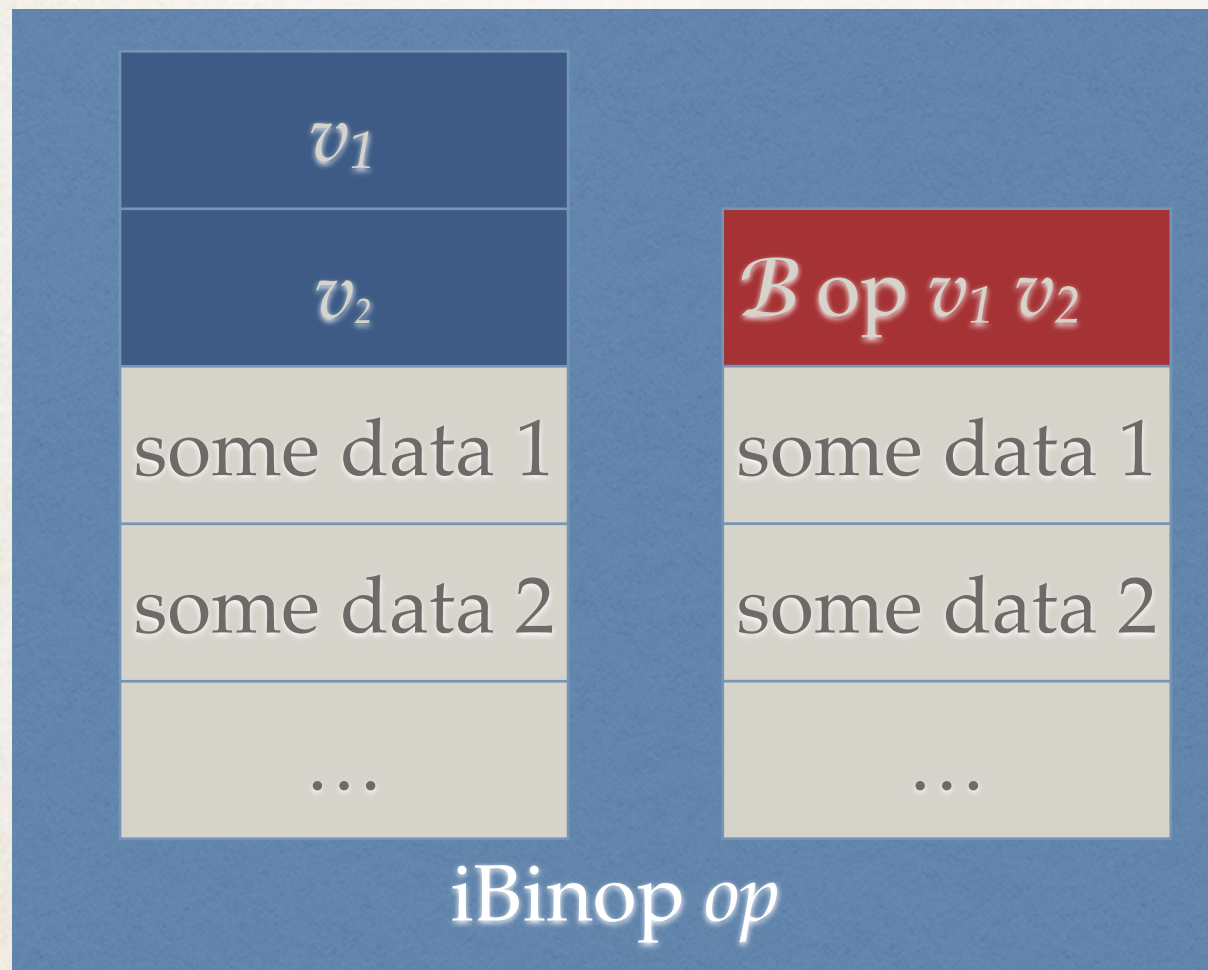

some data 2

...

iConst n

Grammar

Semantics (instrDenote / progDenote)

 $instr ::=$
 $| iConst\ n$
 $| iBinop\ binop$
 $I(iConst\ n)\ s \Rightarrow n :: s$
 $I(iBinop\ op)\ v_1 :: v_2 :: s \Rightarrow (\mathcal{B}\ op\ v_1\ v_2) :: s$
 $I(iBinop\ op)\ s \Rightarrow \text{error}$

If the `iBinop` instruction fails to find two values on the stack, its computation cannot proceed. We consider this situation an error.

Too few values on the stack

Target Language (Revised)

Dealing with Errors

Grammar	Semantics (instrDenote / progDenote)
$\begin{aligned} \text{instr} ::= & \\ & \text{iConst } n \\ & \text{iBinop } \textit{binop} \end{aligned}$	$\begin{aligned} \mathcal{I}(\text{iConst } n) (\text{Some } s) &\Rightarrow \text{Some } (n :: s) \\ \mathcal{I}(\text{iBinop } op) \text{Some}(v_1 :: v_2 :: s) &\Rightarrow \\ &\text{Some}((\mathcal{B} \text{ op } v_1 \ v_2) :: s) \\ \mathcal{I}(\text{iBinop } op) s &\Rightarrow \text{None} \end{aligned}$
$\begin{aligned} \text{program} ::= & \\ & \text{nil} \\ & \text{instr} :: \text{program} \end{aligned}$	$\begin{aligned} \mathcal{P} \text{ nil } \text{Some}(s) &\Rightarrow \text{Some}(s) \\ \mathcal{P} (i :: p') \text{Some}(s') &\Rightarrow \mathcal{P} p' \text{Some}(v :: s') \\ &\text{where } \text{instrDenote } i \ s \Rightarrow \text{Some } s' \\ \mathcal{P} p \text{ None} &\Rightarrow \text{None} \end{aligned}$

Execution of instructions

prog = [**iConst 7**, iConst 3, iConst 2, iBinop +, iBinop ×]

Execution of the program starts with an empty stack

—— **Red** in prog indicates the next instruction to execute

Execution of instructions

prog = [iConst 7, iConst 3, iConst 2, iBinop +, iBinop ×]

A diagram illustrating the execution of instructions. It features a large blue rectangular area representing memory. In the bottom-left corner of this area, there is a small white horizontal line. To the right of this line is a red square containing the white number 7, representing the first instruction in the program.

7

Execution of instructions

prog = [iConst 7, iConst 3, iConst 2, iBinop +, iBinop ×]

Execution of instructions

prog = [iConst 7, iConst 3, iConst 2, iBinop +, iBinop ×]

Execution of instructions

prog = [iConst 7, iConst 3, iConst 2, **iBinop +**, **iBinop ×**]

Execution of instructions

prog = [iConst 7, iConst 3, iConst 2, **iBinop +**, **iBinop ×**]

Execution of instructions

- ❖ Initial state
 - ❖ $\text{prog} = [\text{iConst } 3, \text{iConst } 2, \text{iBinop } +]$
 - ❖ $\text{stack} = \text{nil}$
- ❖ $[\text{iConst } 3, \text{iConst } 2, \text{iBinop } +]$
 nil
- ❖ $[\text{iConst } 2, \text{iBinop } +]$
 $3 :: \text{nil}$
- ❖ $[\text{iBinop } +]$
 $2 :: 3 :: \text{nil}$
- ❖ $[\text{nil}]$
 $5 :: \text{nil}$

Compiler

Compiler

- ❖ $\text{compile} : \text{exp} \rightarrow \text{prog}$
where $\text{prog} = \text{list instr}$
- ❖ $\text{compile} (\text{Const } n) \Rightarrow \text{iConst } n :: \text{nil}$
- ❖ $\text{compile} (\text{Binop } b \ e1 \ e2) \Rightarrow$
 $(\text{compile } e2) ++ (\text{compile } e1) ++ (\text{iBinop } b) :: \text{nil}$

Examples

- ❖ $\text{compile} (\text{Const } 2) \Rightarrow \text{iConst } 2$
- ❖ $\text{compile} (\text{Binop } + (\text{Const } 2) (\text{Const } 3)) \Rightarrow$
 $(\text{iConst } 3) :: (\text{iConst } 2) :: (\text{iBinop } +) :: \text{nil}$

Or, $[\text{iConst } 3, \text{iConst } 2, \text{iBinop } +]$

- ❖ $\text{compile} (\text{Binop } \times (\text{Binop } + (\text{Const } 2) (\text{Const } 3)) (\text{Const } 7)) \Rightarrow$
 $(\text{iConst } 7) :: (\text{iConst } 3) :: (\text{iConst } 2) :: (\text{iBinop } +) :: (\text{iBinop } \times)$

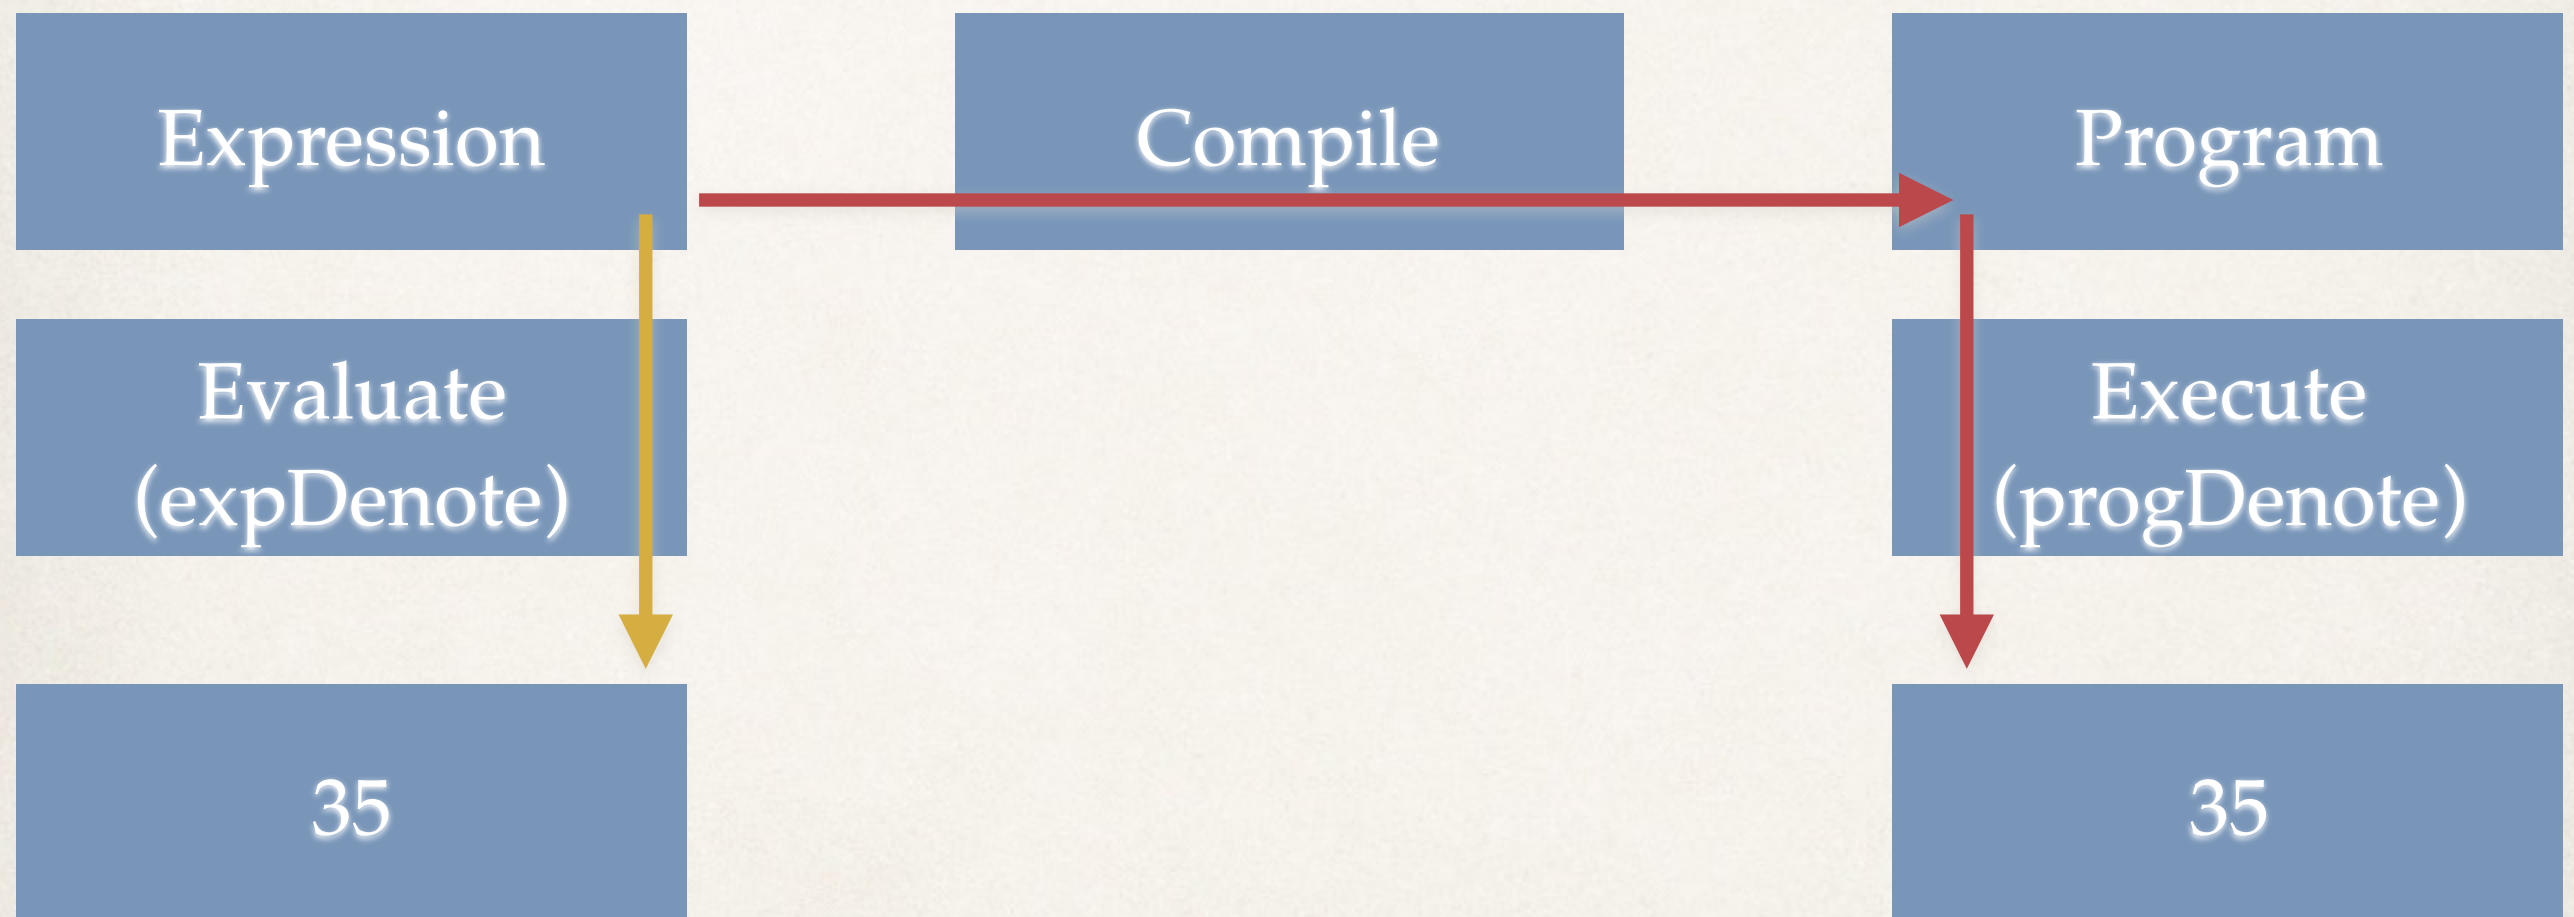

Or, $[\text{iConst } 7, \text{iConst } 3, \text{iConst } 2, \text{iBinop } +, \text{iBinop } \times]$

Correctness

Testing the compiler for some arithmetic expressions

- ❖ $e1 = \text{Const } 2 \Rightarrow 2$
 $\text{progDenote } (\text{compile } e1) \Rightarrow 2 :: \text{nil}$
- ❖ $e2 = \text{Plus } (\text{Const } 2) (\text{Const } 3) \Rightarrow 7$
 $\text{progDenote } (\text{compile } e1) \Rightarrow 7 :: \text{nil}$
- ❖ $e3 = \text{Times } (\text{Plus } (\text{Const } 2) (\text{Const } 3)) (\text{Const } 7) \Rightarrow 35$
 $\text{progDenote } (\text{compile } e1) \Rightarrow 35 :: \text{nil}$

Interpretation vs Compile & Go

Correctness condition for the compiler

- ❖ Every arithmetic expression, should be translated by the compiler to equivalent stack machine program.
- ❖ for all e . $(\text{compile } e) \text{ equiv. } e$

Correctness condition for the compiler

- ❖ Every arithmetic expression, should be translated by the compiler to equivalent stack machine program.
- ❖ for all e . $(\text{compile } e) \text{ equiv. } e$
- ❖ for all e .
$$\text{denoteProg } (\text{compile } e) = (\text{expDenote } e) :: \text{nil}$$
